

Live Domain-Specific Languages

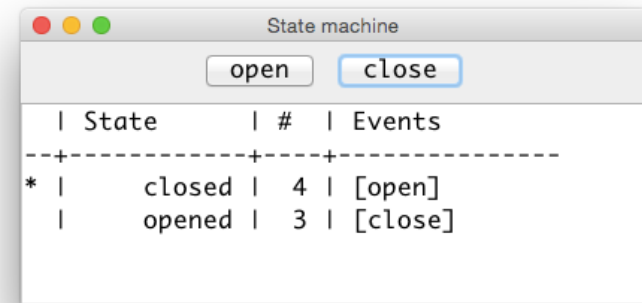

State Machine Visual & Textual Definition

```

machine doors
state closed
  open => opened
state opened
  close => closed
end
  
```

State Machine Run-Time

State	#	Events
* closed	4	[open]
opened	3	[close]

Goal: Raise productivity of non-programmer experts with visual programming languages that give constant (live) feedback about code changes.

Problem: Live languages require migrating run-time state with code changes.

Approach: Provide a reusable framework utilizing semantic deltas for designing and constructing stateful visual programming languages.
